Iteration Plan Week 2

For Nov. 28, our team's second iteration will build on our initial effort by refining the search algorithm for matching members to include some of the criteria specified in the initial project proposal. We will also handle cases where one team size could potentially be much different from the specified team size. We will design the software in such a way that teams will be as close in size as possible to each other.

The framework will largely remain in place, and no significant GUI changes will take place. Our core code is fairly rigorous and won't require any major refactoring, barring any changes to the main features or requirements of the system. We will simply create a new matching strategy to better resemble the requirements for this system.

What features were implemented during this iteration? Remember that the features list is your main interaction with the client. always report progress in terms of features.
Do you have evidences (screenshots) of the GUI progress?
What functionality did you test? Do you have evidences of your tests?
